## The Myth of Teacher Shortage in India

Sandip Datta<sup>1</sup>

Geeta Gandhi Kingdon<sup>2</sup>

### Abstract

This paper examines the widespread perception in India that the country has an acute teacher shortage of about one million teachers in public elementary schools, a view repeated in India's National Education Policy 2020. Using official DISE data, we show that there is hardly any net teacher deficit in the country since there is roughly the same number of surplus teachers as the number of teacher vacancies. Secondly, we show that measuring teacher requirements after removing the estimated fake students from enrolment data greatly reduces the required number of teachers and increases the number of surplus teachers, yielding an estimated net surplus of about 342,000 teachers. Thirdly, we show that if we both remove fake enrolment and also make a suggested hypothetical change to the teacher allocation rule to adjust for the phenomenon of emptying public schools (which has slashed the national median size of public schools to a mere 64 students, and rendered many schools 'tiny'), the estimated net teacher surplus is about 764,000 teachers. Fourthly, we highlight that if government does fresh recruitment to fill the supposed nearly one-million vacancies as promised in the National Education Policy 2020, the already modest national mean pupil-teacher-ratio of 22.8 would fall to 15.9, at a permanent fiscal cost of nearly Rupees 480 billion (USD 6.6 billion) per year in 2017-18 prices, which is higher than the individual GDPs of 56 countries in that year. The paper highlights the major economic efficiencies that can result from an evidence-based approach to teacher recruitment and deployment policies.

## I. Introduction

There is a widespread perception in India that an important reason for the pitiable learning levels in elementary schools is a great paucity of teachers in public elementary schools. India's National Education Policy (NEP 2020) acknowledges the learning crisis (Section 2, p.8) and apports blame for it partly on high pupil teacher ratios (PTRs) which it says arise from a shortage of one million teachers,<sup>i</sup> and on page 8 it promises that “teacher vacancies will be filled at the earliest”.

The NEP is not alone in rueing a paucity of teachers in India. The belief of an acute teacher shortage is shared by many Indian experts and organisations, based on data circulated by the Ministry of Education, which have been cited in the Indian parliament<sup>ii</sup>. A study by India's NITI Ayog (Planning Commission) stated that “India today suffers from the twin challenges of unviable sub-scale schools and a severe shortage of teachers” (*Times of India*, 2020). A Senior Fellow at Centre for Policy Research – probably India's best known think tank – when commenting on the Indian budget 2018 stated that not much can be achieved “without addressing the huge shortage of teachers” (Bhatti, 2018). Newspaper headlines citing “severe shortage of teachers in public schools” (*Indian Express*, 2018), “India faces an acute shortage of educators across states” (*Forbes India*, 2019), and “Acute shortage of primary teachers in India” (*Hindustan Times*, 2014) are common, and a UNESCO (2016) report states that “74 countries face an acute teacher shortage; while Nigeria tops this list, India is second”. A former Director of the National Council of Educational Research and Training (NCERT) said that “estimates suggest that India needs 1.3 million teachers” (Kumar, 2016).

India's *Right to Education Act 2009* (RTE Act) mandates a maximum pupil-teacher ratio (PTR) of 30:1 in elementary schools<sup>iii</sup>. Following the Act's implementation in 2010, average PTR in public elementary schools declined steeply from 31.2 to 22.8 pupils per teacher in the seven years to 2017. Notwithstanding this reduction in PTRs, learning levels fell over the same period<sup>iv</sup>. This suggests simplistically a perverse positive temporal relationship between PTR and pupil learning, rather than the expected negative one on which the advocacy to reduce PTRs is usually based. The RTE Act establishes the norms for the allocation/appointment of teachers to schools, based on its stipulated PTRs.

Ultimately, behind any norms for the allocation of teachers to schools is the rationale of pedagogic desirability, subject to economic affordability, i.e. the question: would the PTR resulting from the given teacher-allocation norms be conducive to student learning? While it is not the central object of this paper to judge whether the RTE Act's teacher-allocation norms and resulting permitted maximum PTR of 30:1 are ‘right’, it is worth noting briefly that there is an applied literature that addresses this question. Studies on the impact of PTR (or class-size) on student learning in India generally do not find the expected negative relationship between PTR and student learning outcomes (Banerjee et. al., 2009; Muralidharan and Sundararaman, 2013; Muralidharan et. al., 2017; and Datta and Kingdon, 2021)<sup>v</sup>. Thus the literature for India does not support giving a learning-related rationale for reducing PTR to a maximum of 30.

In the much larger international literature too, there is no consistent relationship between PTR and pupil learning (Hanushek, 2002). The studies that do show the expected negative relationship find that the size of the relationship is very small<sup>vi</sup>. Given these findings, the prescription of India's RTE Act 2009 to set a maximum PTR of 30, the advocacy of India's National Education Policy (NEP, 2020) to urgently fill the nearly one million teacher vacancies (when the national PTR is already as low as 22.8), and the widespread perception of an acute teacher shortage, seem not to be evidence-based.

The main questions we address are: whether India has enough teachers to fulfil the PTR norms enshrined in the *Right to Education Act*. We probe the education ministry's estimates of teacher vacancies, which are the basis for the perceived acute teacher shortage. We explore teacher surpluses, and ask how the net teacher surplus estimate varies after removing fake pupils from the enrolment data. We also ask how teacher surplus changes after altering the teacher allocation rule which currently allocates 2 teachers each to the numerous

‘tiny’ schools with ‘20 or fewer’ children (which have an average of 12.6 pupils per school). Finally, since resources are scarce, the paper evaluates the fiscal cost of maintaining the PTR at prescribed levels, and the permanent fiscal burden on states due to additional recruitment, fake enrolment and the existence of tiny schools. The analysis is carried out only for public elementary schools in each of 21 major states of India.<sup>vii</sup>

## II. The Small School Phenomenon: Implications for Pupil Teacher Ratio

Table 1 shows that in the seven year period between 2010 and 2017, the number of public elementary schools remained roughly constant in the country, at around 1.035 million<sup>viii</sup>, but that the number of private unaided schools increased by 123,000. Table 2 shows that over the same seven year period, total pupil enrolment in public schools fell by 24 million and but in private unaided schools enrolment rose by 21 million. Table 3 is an update of a table from Kingdon (2020) which shows that the phenomenon of ‘small’ schools ( $\leq 50$  pupils) and ‘tiny’ schools ( $\leq 20$  pupils) has grown over time : the percentage of ‘small’ schools rose from 30.2% in 2010 to 41.2% by 2017-18, i.e. the emptying of public schools has led to an increase in the small public schools phenomenon, creating pedagogic and economic non-viability. The last column of Table 3 shows that government’s teacher-salary-expense-per-pupil in its ‘small’ schools increased from Rs. 1952 per month in 2010 to Rs. 4,326 per month in 2017. Table 4 suggests considerable variation across states in the percentage of ‘small’ schools ( $\leq 50$  pupils), which ranges from 3.8% in Bihar to 78.8% in the hilly state of Himachal Pradesh.

Similarly, the phenomenon of ‘tiny’ schools also increased over time. Table 3 shows that in 2010 they constituted about 6% of all public schools but by 2017, 12.3% of all public schools were ‘tiny’ ( $\leq 20$  pupils), though there is significant variation across states, as seen in Table 4. Uttaranchal has the highest proportion of tiny schools (46.2%) followed by Himachal Pradesh and Jammu-Kashmir. Table 3 shows that average teacher-salary-expense-per-pupil in ‘tiny’ public schools rose to Rs. 8,111 per month by 2017.

Table 4 column (g) suggests that 67.6% of all public elementary schools in the country had fewer than or equal to 100 pupils, but the average school size in such schools was 45.3 pupils, which means fewer than 9 students per primary grade. Average school size in Uttaranchal was a mere 26.9 pupils, which means fewer than 6 students per grade.

NEP 2020 recognises the fact of numerous very small schools and it also acknowledges that “small school sizes have rendered it economically suboptimal and operationally complex to run good schools, in terms of deployment of teachers as well as the provision of critical physical resources” (NEP 2020, p.28).

The abandonment of public schools (Table 2) led to an increase in the number of small/tiny schools and also to a *sharp reduction in pupil teacher ratio (PTR) from 31.2 in 2010 to 22.8 in 2017*. Table 5 shows that by 2017 about 70% of all public elementary schools had a pupil teacher ratio below 30; 46% (about 476,000 schools) had a PTR below 20; and 15.4% (about 160,000 schools) had a PTR below 10 pupils per teacher. In the hilly states Jammu-Kashmir, Himachal Pradesh and Uttaranchal, and in Kerala, more than 75% of schools had PTR of  $\leq 20$ , and even Telangana, Tamil Nadu, Punjab and Andhra Pradesh had more than 60% public schools with PTR  $\leq 20$ . In the hilly states, more than 50% schools had PTR below 10, raising questions about their viability.

## III. Surplus teachers in small and tiny schools

Table 6 shows that a high percentage of small schools have surplus teachers. The Right to Education (RTE) Act mandates that two teachers shall be appointed in any school with up to 60 enrolled children. Thus, if a school with up to 60 pupils has more than two teachers, it is said to have surplus teachers. We define schools with up to 60 pupils as ‘small schools’ for the remainder of this paper. Table 6 shows the percentage

of ‘small’ schools with given levels of enrolment and more than two (>2) teachers, i.e. the percentage of small schools that have surplus teachers.

Column (f) shows that 30.8% of ‘small’ schools had surplus teachers. This column is based on actual enrolment, after adjusting for fake enrolments in the way given in the Note to Table 7. The percentage of small schools with surplus teachers is 94.2% in Kerala and 59.6% in West Bengal, and is greater than 40% in Bihar, Assam, Kashmir, Haryana and Punjab. Surplus teachers lead to high PTRs and high per-pupil-cost, as we show later in the paper.

Table 6 column (a) shows that nationally 12.7 per cent of all tiny schools had surplus teachers, i.e. 12.7% of schools that were ‘tiny’ ( $\leq 20$  pupils) had  $>2$  teachers. The problem of ‘tiny’ schools with surplus teachers is the most acute in Kerala, where 82% of all tiny schools had  $>2$  teachers, but in many other states too, a high percentage of public schools were in a situation of grave economic unviability – Uttar Pradesh, Bihar, West Bengal, Assam, Jammu & Kashmir and Himachal Pradesh were among the top contributors to such economically non-viable schools. We know from Table 3 that *average* size of schools that had a total enrolment of  $\leq 20$  pupils was only 12.6 pupils, so having 3 teachers (i.e. 1 surplus teacher) implies a PTR of about 4.2 pupils per teacher!

#### IV. Adjustment for Fake Enrolment, and Different Concepts of Pupil Teacher Ratio

Table 7 examines the 2017-18 pupil teacher ratio (PTR) by state, and shows how PTR changes with the definition of PTR. It is important to highlight that the elementary PTR of 22.8 in column (e) is the *prima-facie* PTR, being based on total *school-self-reported*<sup>dx</sup> pupil enrolment (column a) divided by the total number of appointed teachers (column d). This uncritically uses what are known to be inflated enrolment numbers based on fake/ghost names entered by the school to show a higher than actual enrolment. The District Information System on Education (DISE) is collected via a Data Capture Format sent to schools and thus, *it is school-returns data*. Questions have been raised from time to time about the veracity and trustworthiness of self-filled enrolment data from DISE.

There are economic incentives for public schools to over-report enrolments since grains for mid-day meals, cloth for school uniforms, scholarship money for SC/ST students, and even the number of teachers appointed, all increase with the self-reported number of enrolled children in a school, and there appear to be no explicit penalties for over-reporting enrolments.

The Comptroller and Auditor General (CAG) of India found 38% inflation in DISE pupil enrolment data in the public elementary schools in Bihar (CAG, 2014). Similarly in Bihar Kingdon and Banerji (2009) reported the presence of fake enrolment of 35%<sup>o</sup>, and they found fake enrolment of 16% in Uttar Pradesh. The Mid-Day Meal Authority reports overstated enrolment in public schools (*Times of India*, 2015) too. A performance audit of the Mid Day Meal (MDM) scheme in India by CAG in 2015 stated that: “The mechanism in place for assimilating data on the number of children availing MDM was seriously compromised. The percentage of actual number of children availing MDM as gathered from various sources was consistently lower than that furnished by the states to the Ministry for claiming cost of foodgrains and cooking cost. Audit evidenced an institutionalised exaggeration of figures regarding students availing MDMs” (page vi); it concluded that “Audit observed mismatch in the data relating to the number of children availing MDM as reported vis-a-vis the number of children actually availing MDM during the day of visit to sampled schools by the monitoring institutions” (page viii); and it went on to recommend that “The data submitted by states should be carefully examined through independent checks. A system of obtaining consent in respect of children availing MDM may be incorporated to check manipulation of figures” (page viii, Report No. 36, CAG, 2015).

In September 2015, the DISE enrolment data for the Lucknow district were reviewed by the District Magistrate who ordered for a survey to be carried out by the district Basic Education Officer (*Basic Shiksha Adhikari*). The survey showed that 18% of students in Lucknow were “absent for long period” and the District Magistrate ordered that these children not be regarded as enrolled (*Times of India*, 2015a). This is fairly consistent with the findings of the SchoolTELLS survey of 80 rural primary schools in 5 districts of Uttar Pradesh<sup>xi</sup> where each school was visited 4 times in the year 2007-08, and it was found that 16% of students in the enrolment registers were never present in the school in any of the four survey visits, i.e. 16% of the total primary school enrolment was fake (Kingdon and Banerji, 2009). A joint survey by CAG and the Mid Day Meal Authority (*Times of India*, 2015b) showed that there is widespread over-reporting of enrolments in the enrolment registers of public schools in Uttar Pradesh, with “over 10% students mentioned in class register being absent all through the year in nearly every government school”.

Finally, a recent CAG report (CAG, 2017) showed that there were about 10% more students in elementary school than there are children in the state, implying that there is large-scale over-reporting of school enrolments. Since there are no incentives for over-reporting enrolment by private schools, and since in UP 53% of total enrolment is in private schools and 47% in government schools (DISE, 2017-18; ASER, 2016), this implies a 21.3% inflation/over-reporting in government school enrolment, i.e. just over 20% fake enrolment in government schools. Secondly, and more worryingly, the same CAG report – which surveyed 428 elementary schools in UP in 2016 – found that the attendance rate was a mere 27% (CAG 2017, p. 26 and Appendix 2.1.18), showing that a very high proportion of so-called 'enrolled' children in fact have a tenuous connection with the school, representing no meaningful school participation, and the CAG report remarked that the UP state officials had reported an attendance rate of 61% to 91% at the AWP&B (Annual Work Plan and Budget) process in Delhi. This large discrepancy (27% versus 61%-91%) suggests that officials may have some incentive to inflate pupil enrolments just as they felt compelled to inflate pupil attendance rates. Finally, this CAG report also said that 2 million children drop out of school each year, which implies that they are shown as admitted and enrolled at the start of the school year, but are not found in school later in the school year.

The above evidence on inflated/fake enrolment seems to be corroborated when we look at the distribution of school enrolment. Figure 1 shows the histogram of school size and it shows that schools’ self-reported total enrolment is lognormally rather than normally distributed. We know from Table 4 that mean school size in the 1.035 million public elementary schools in the country is 99 students but, when a quantity is lognormally distributed, median is the better measure of central tendency than the mean. The median size is a mere 64 students, and the mode occurs at a school size of 30 pupils.

Another striking feature of the histogram is that at multiples of 5 and especially of 10, reported enrolment jumps, so the distribution is not smooth but jagged. Firstly, it appears that school respondents are reporting rounded-up enrolment numbers around the multiples of 10, because immediately before there is a pronounced dip. For example, immediately before school size 50, there is an unexpected low frequency of schools that report having exactly 49 pupils, and similarly around 20, 30, 40 and 80, etc. Secondly, the most pronounced jumps are at the enrolment levels where a major benefit exists, the biggest jump being at enrolment 61 (and an accompanying dip at enrolment of 59 and 60) with an unnaturally high frequency of schools reporting an enrolment of 61 and a bit above: it is known that as per the RTE Act, two teachers are given to schools whose total enrolment is up to 60 pupils, but three teachers are allotted for enrolment of 61 to 90 pupils, hence there is an incentive to over-report enrolment of 61 or immediately above. The next biggest jump is at an enrolment of 100, presumably because in upper primary schools a headmaster is allocated to schools that have an enrolment of 100 or above; similarly, we see another conspicuous jump at enrolment of 150, at which the RTE Act mandates that primary schools will get a headmaster. To illustrate from one large north Indian state, the jump at a reported enrolments of 60 and of 100 is far more pronounced in Uttar Pradesh and the phenomenon of rounded reporting of enrolment is more accentuated there (Figure 2). In summary, there is evidence that a good number of schools are reporting inflated student

enrolment numbers, and this appears to be related to the creation of teacher or head-teacher posts, but is partly also due to reporting rounded-up enrolment numbers, rather than exact numbers.

Given such widespread official acknowledgment of inflated/fake enrolment numbers, the de-facto or real PTR is likely to be lower than the observed *prima facie* PTR of 22.8. Student absence rate – measured via independent, non-official/non-DISE surveys – captures both fake enrolments as well as the absence of genuine enrolees. Table 7 column (f) reports that student attendance rate is 72% at all India level, and that it is as low as 55-56% in Bihar, Madhya Pradesh and West Bengal, and as high as 91% in Tamil Nadu (ASER 2018 report).

To estimate the true PTR, first column (j) of Table 7 reports the total enrolment of public elementary schools in a state after removing the estimated ghost/fake enrolment. Based on that, column (k) reports the ‘true’ PTR after removing fake enrolment. Compared to the *prima facie* national PTR of 22.8 (column e), the true PTR is 19.6, i.e. very substantially lower than the mandated maximum of 30 in the RTE Act. The true PTR is much lower than 30 in all states except Jharkhand and Bihar, whose true PTR hovers around 30. The true PTR is 20 or lesser in 15 out of India’s 21 major states. This speaks of an extremely large number of surplus teachers in relation to the teacher-allocation norms of the RTE Act, and it calls into question the notion that there is an acute teacher shortage in the country.<sup>xiii</sup>

#### V. Teacher Vacancies, Surpluses, and the Net Teacher Surplus

In this section we examine the number of teacher vacancies reported by the ministry of education (which until 2020 was named ‘Ministry of Human Resource Development’ or MHRD). As mentioned in the Introduction above, the draft National Education Policy (NEP, 2019) identified pupil teacher ratios above 30 as an important factor behind poor learning levels (page 63, section 2.14), stated that the country faces one million teacher vacancies (page 115), and suggested that the government’s education budget should be increased by 1.05 percentage points for filling teacher vacancies and better teacher resourcing (page 417, Table A1.4). If done, this additional recruitment of teachers would create a permanent fiscal liability for government. While answering the unstarred question number 1953 in parliament on 30.07.2018, the MHRD minister replied that total number of teacher vacancies in public elementary schools is 900,316 in all states/UTs (see endnote ii).

Column (c) of Table 8a reports the total number of teacher vacancies in public elementary schools as per Ministry, and column (d) reports our own estimates of vacancies based on *prima facie* (i.e. reported) pupil enrolment and number of teachers for each school in the 2017-18 DISE data, after applying the RTE Act’s teacher allocation norms. We have reported data from both sources (Ministry and our own) only on 21 major states of India<sup>xiii</sup>. As against the total of 882,200 vacancies reported by the Ministry, our own estimates show only 761,730 vacancies in these 21 major states<sup>xiv</sup>.

We are not aware of any journalistic or policy discussion on teacher *surpluses* in schools, i.e. on whether there are more teachers in schools than the number based on RTE Act’s teacher allocation norms, and we were curious to see to what extent there were any teacher surpluses in the various states. Examining this would reveal whether there would be an overall net teacher deficit or a net teacher surplus in the state.

Table 8a’s column (e) presents our estimate of teacher surplus in each state, and column (f) shows the net teacher surplus/deficit. Column (e) shows that the total number of surplus teachers in 21 major states was 735,067. In column (f) negative values show the actual number of teachers required (net vacancies) and positive values show the net excess teachers (net teacher surplus). This analysis shows – at the all India level – there are only 26,660 net teacher vacancies in the country, as opposed to 882,200 vacancies shown in the government report (MHRD, 2018).

This is a major finding, and it alters our perceptions of a severe teacher shortage. To be sure, in schools with fewer teachers than those mandated by the teacher-allocation norms one can legitimately say there is a teacher shortage, but in speaking of an overall teacher shortage, there is a presumption that teachers cannot be transferred or redeployed from nearby schools that have surplus teachers, e.g. within the district.

Aggregate national analysis masks inter-state variation, and redeployment cannot usually occur across states due to language and cultural barriers, and because teachers are paid out of state government budgets. Thus, the appropriate unit of analysis is the state, rather than India as a whole. Table 8a is sorted by column (f), i.e. from the highest to the lowest net teacher surplus state. Closer inspection of column (f) shows that, in fact, in 13 of the 21 major states, there are net surpluses, totalling to 421,158 net surplus teachers (according to MHRD estimates, these states together have 271,949 vacancies!). Only eight states have net teacher vacancies, and these total to 447,818 net vacancies (these facts are more clearly visible in Figure 3). However, it is impractical to have interstate redeployment, so state-wise analysis is necessary.

It is anecdotally believed that urban areas have a glut of teachers and rural areas have teacher shortages since teachers prefer urban postings. If this is the case, we could simply redeploy teachers from urban to rural areas, instead of fresh appointments. Table 8b does the analysis separately by rural and urban area within each state. It repeats columns (d), (e) and (f) of Table 8a. The last row of Table 8b shows that indeed there was a net deficit of 119,220 teachers in rural areas and a net surplus of 92,565 teachers in urban areas (national net deficit of 26,665), which seems to support the anecdotal belief of rural shortages and urban gluts. However, since it is infeasible to redeploy teachers across states, we must consider separately for each state.

Table 8b shows that in thirteen states, there was net teacher surplus in both rural and urban areas, so that there is no issue of urban to rural redeployment in these states, it is an unambiguous net surplus within rural areas and also within urban areas, though district-wise rural-urban analysis by each state government would be useful for planning purposes. West Bengal has the biggest number of net surplus teachers (87,187) out of which 63,702 are surplus in rural areas and 23,485 are surplus in urban areas. Tamil Nadu has a total of 75,430 net surplus teachers, 49,740 in rural areas and 23,485 in urban. Apart from these thirteen states, i.e. in the remaining eight states, there is a net deficit of teachers as seen in column (c) of Table 8b. When we bifurcate by rural-urban in the remainder of the table, the dominant story is one of fairly large net teacher deficits in rural areas of these eight states, with few net surplus teachers in their urban areas. Thus, it is these eight states (Bihar, Jharkhand, Madhya Pradesh, Uttar Pradesh, Karnataka, Gujarat, Odisha and Maharashtra) that need close attention from a teacher shortage perspective.

Appendix Tables 2a and 2b illustrate district level analysis for 14 districts across three divisions of one state, namely Uttar Pradesh (there are 75 districts in UP and 650 districts in India). Districts in a division are all in contiguous close proximity and it is often feasible to commute across adjoining districts. The first of these tables shows the net surplus/deficit teachers based on reported enrolments, and the second table shows the estimated surplus/deficit teachers after removing fake enrolment. The first of these shows that in the Meerut Division, Meerut and Hapur districts had a surplus of 373 and 151 teachers respectively but that several districts in the Division had teacher deficits. It may be possible to redeploy teachers across these adjoining districts. We see that in rural Ghaziabad, 181 teachers are surplus but that in urban Ghaziabad there is a deficit of 228 teachers, suggesting a rural to urban redeployment to fix much of the teacher deficit. Overall within this Division, there is a rural surplus of 339 teachers and an urban deficit of 557 teachers, and redeployment can fix about 60% of the teacher deficit (339 teachers), rather than recruiting 557 teachers for urban Meerut Division. But redeployment depends on political feasibilities, given possible opposition from teachers and their unions.

## VI. Net Teacher Surplus, after removing fake enrolments

All the analysis in Table 8a up to column (f) was done taking reported enrolment at face value, without removing any fake enrolments. As shown in section IV, according to the Comptroller and Auditor General of India, and also according to the Mid Day Meal Authority of India, schools' self-reported enrolment is *institutionally exaggerated* or inflated, i.e. there is much fake/ghost enrolment. In columns (g), (h) and (i) of Table 8a, we recomputed the actual teacher vacancies and surpluses after adjusting the ghost enrolment, and this led to a dramatic change in teacher vacancies, surpluses and 'net vacancies'. The total teacher vacancies in India (21 major states) fell from 761,727 (column d) to 518,515; Surplus teachers rose from 735,067 to 860,456, and net vacancies of 26,660 teachers converts to a surplus of 341,941 teachers.

In light of this large teacher surplus, appointing nearly one million teachers in the erroneous belief of a teacher shortage would impose an extremely high permanent fiscal burden, beyond that envisaged by the RTE Act. According to the literature on the effect of class-size on student learning, such an increase would also not lead to learning gains either.

Considering inter-state variation, we see that the impact of removing fake pupils is dramatic in Bihar where net vacancies fall from 204,778 to only 40,975 teachers, because in Bihar 35% of reported enrolment is fake (CAG, 2014). In Uttar Pradesh, before adjusting for fake enrolment, there were 51,530 net teacher vacancies but after adjustment, this converts to a net surplus of 20,274 teachers. These facts are clearly seen in Figure 3.

Importantly, in the aggregate, we see that after removing fake enrolment, in fourteen states there is a very substantial teacher surplus, which totals to 5,15,704 teachers, which is maintained at a cost to the public exchequer of Rs. 265.9 billion (approximately US \$ 3.63 billion) per annum in 2017-18 terms. It is only in seven states that there is still a teacher deficit, and it is a total deficit of 173,763 teachers, compared to the education ministry's figure of 882,200 vacancies (see Figure 3 for a graphical analysis). Indeed, only the four states of Karnataka, Madhya Pradesh, Bihar and Jharkhand have the bulk of net teacher deficit of a total of 149,825 teachers. Our analysis implies that national policy makers need to focus on teacher shortages mainly in these four states.

Doing the analysis separately for rural and urban areas after removing ghost students (data not shown due to space considerations), we find that the overall net teacher surplus of 341,941 is made up of 220,109 net surplus teachers in rural India and of 121,837 net surplus teachers in urban India. In 14 states' rural areas, there are net surplus teachers totalling 400,471 and in seven states there is a net deficit of 180,362 teachers. In urban areas, there are hardly any net teacher deficits.

## VII. Fiscal Cost of Surplus Teachers and Recruitment

In the previous section, we reported that there exist net surplus teachers in many states and, on top of that, due to a perception of widespread teacher vacancies, state governments are faced with the expectation that they will appoint more teachers. Politicians may also face pressure (i) not to demand data on surplus teachers where they exist, (ii) not to ask for removal of ghost students before teacher vacancy numbers are calculated, (iii) not to ask for data on overall PTR (which could undermine the case for more teacher appointments), and (iv) not to seek redeployment of teachers from teacher-surplus to teacher-deficit schools (so that vacancies can be shown and fresh recruitment can be justified).

If the RTE Act's teacher deployment norms are followed properly, with any surplus teachers (in teacher-surplus schools) being first redeployed to teacher-deficit schools before recruiting to fill the remaining genuine vacancies, then there would be actual teacher vacancies in only 8 out of 21 major states, and there would be net surplus teachers in the remaining 13 states, as seen in column (f) of Table 8a. If states with surplus teachers do not redeploy them to teacher-deficit schools and, instead, recruit additional teachers to

fill vacancies in the teacher-deficit schools, it creates an unwarranted additional fiscal burden, wastage and economic inefficiency.

The last two columns of Table 8(a) estimate the savings from a rational and efficient deployment of teachers, i.e. by strictly following the RTE Act's teacher allocation norms. Column (i) shows that the cost of filling all 882,200 teacher vacancies (inefficiently, without doing any redeployment) would be Rs. 478.79 billion. However, filling only the *net* vacancies would cost a mere Rs. 23.33 billion. That is, if states with net surplus dispense with their surplus teachers, and states with net deficit teachers first redeploy their teachers from surplus-teacher schools to deficit-teacher schools, before recruiting additional teachers to fill the remaining vacancies, the government would save Rs. 455.46 billion every year (US\$ 6.2 billion).

Table 9 presents estimates of the fiscal burden on the public purse due to the presence of surplus teachers and additional recruitment. Column (c) shows the total surplus teachers in different states if government maintained a PTR of 30 rather than the current lower PTR. It shows that out of 4,481,978 existing teachers in public elementary schools, 1,071,299 (or 24% of all teachers) would be surplus in India in 2017-18, if PTR were maintained at 30. Only Bihar and Jharkhand would have a net deficit of teachers as per RTE norms. On top of this over 1 million surplus teachers, state governments are asked in the National Education Policy to fill teacher vacancies "as soon as possible" (NEP 2019, p. 58), i.e. to recruit an additional 882,200 teachers, and the Appendix of NEP (2019, p. 417) gives the percentage increase in the budget that will be required to recruit these additional teachers.

If governments go ahead with this proposed additional recruitment, the total stock of elementary teachers will rise from 4.4 million to 5.4 million, and this would further reduce PTR from the current 22.8 to 15.9, i.e. a reduction of about 7 pupils per teacher (see column (g) of Table 9). We report two sources of 'excess costs', i.e. salary costs due to surplus teachers that are not warranted by the teacher-allocation norms of the RTE Act. The first excess cost is the fiscal cost of maintaining the current PTR of 22.8, i.e. a PTR below 30, and column (i) estimates this to be Rs. 551.69 billion per year (in 2017-18 terms). The second concept is the fiscal burden of the proposed additional/new recruitment to fill the 882,200 claimed teacher vacancies (which exist mostly due to fake enrolment and non-redeployment), which column (j) estimates to be another Rs. 478.79 billion per year, which is the cost of reducing PTR by seven pupils per teacher, to a PTR of 15.9. Therefore, the total annual fiscal burden of surplus teachers and additional recruitment is Rupees 1030.48 billion (US \$ 14.1 billion), which is higher than the total GDP of Mongolia or Mauritius and about double the GDP of Malawi. The international and Indian literature on the effect of PTR or class-size on student learning does not lend support to the idea that reducing PTR from 30 or 22.8 to 15.9 would raise learning levels much, or even at all. NCERT (2016) shows that children's learning levels in grade 5 in public elementary schools fell over the period 2011 to 2015, a period over which PTR fell sharply from 30 to 24 at great cost to the exchequer.

### **VIII. Fiscal Cost of Teacher Absenteeism and Fake Pupil Enrolment**

The public exchequer's scarce funds are wasted not only if there are surplus teachers but also due to a high degree of teacher absence and fake/ghost student enrolment. In this section we calculate the cost of these factors.

Table 10 presents the annual fiscal cost due to teacher absence and due to fake enrolment. Nationally the pupil absence rate is 28% (column d), which implies an attendance rate of only 72% of enrolment. Column (f) is based on that portion of the 'pupil absence' which is due to ghost/fake enrolment. The table shows that the total cost of *ghost* pupil enrolment (column g) is Rs. 265.14 billion, and the cost of ghost enrolment in just three states (UP, Bihar, West Bengal) is Rs. 151.63 billion.

The cost of teacher absence for any given state is calculated by taking the total teacher salary cost in the state and multiplying that with the teacher absence rate in the state. The cost of teacher absence is Rs. 362.42 billion every year, nationally (column h). Adding this to the cost of ghost pupil enrolment gives the total fiscal cost due teacher absenteeism and fake pupil enrolment of Rs. 627.56 billion (US\$ 14.0 billion). The problem of fiscal wastage in education is the greatest in Uttar Pradesh, Bihar, Madhya Pradesh and West Bengal.

### **IX. Sub-optimal choice of pupil teacher ratio**

Underlying the RTE Act's stipulation to fix PTR at a maximum of 30 was the framer's belief that lowering PTR and class-sizes (raising teacher 'input') would raise pupil achievement. However, as mentioned in the Introduction, the Indian and international literature generally shows either no relationship or a perverse positive relationship between class size and pupil learning, and in the few studies where it shows a negative effect from PTR onto learning, the size of the effect is very small. In India, while studies by Muralidharan and Sundararaman (2013) and Banerjee et. al. (2009) examined the relationship between class-size and pupil achievement at the primary school level, Datta and Kingdon (2021) examined it for the secondary school level. Datta and Kingdon (2021) found that in the class-size and learning relationship, there exists a flat region where raising the class size does not reduce student achievement. This flat part of the relationship ranges from a class size of 27 to 40 students in science subjects, and between a class size 27 to 51 in non-science subjects. This finding suggests that raising class sizes in these ranges would not lower pupil achievement levels. It is not known to what extent the idea of the flat range applies at the elementary school level, but Banerji et. al. (2009) find that reducing class size (which is closely related to PTR) did not improve learning levels at the primary school level. In the literature, there is no evidence from any setting that there are 'threshold' effects of class size, i.e. that learning would be much worse (non-linearly if not discretely) at class size  $N+1$  than at a given threshold  $N$ , and there is no evidence that the  $N$  at which there is such a threshold is equal to 30. In other words, there is no discrete phase shift above a class size or PTR of 30. A mechanical application of the RTE law supposes that it is important that class sizes not be above 30 when (a) it is not clear that class-size matters at all, (b) it is not clear that 30 is not in the flat range, and (c) even if it is not flat, it is not a 'threshold'.

If raising PTR from its current 22.8 pupils per teacher to a PTR of 30 or even 40 does not lower student learning, there can be extremely large savings on teacher salary costs. Table 11 explores the consequences for government spending on teacher salaries if PTR were maintained at given levels. It examines what government costs and savings would be at various hypothetical PTR levels. Column (f) shows that the total cost of teacher salaries in 2017-18 when overall PTR nationally was 22.8, was Rs. 2069.89 billion annually (in 2017-18 rupees) in public elementary schools. It shows that if government maintained the (RTE Act mandated maximum) PTR of 30, total spending on teacher salaries would reduce to Rs. 1781.37 billion per annum (in 2017-18 prices), which means a saving of Rs. 288.52 billion (about US \$ 4 billion) per year.

The 12th-century rabbinic scholar Maimonides argued that class size should be maintained at 40 pupils, which is generally known as the Maimonides rule (Angrist and Lavy, 2002). If the government maintained a PTR of 40 in elementary schools, that would cost Rs. 1336.02 billion vis-à-vis the current Rs. 2069.89 billion annually, and consequently total savings would be Rs. 733.86 billion (about US \$ 10 billion) per year. As per the extant Indian literature on the impact of class size, it seems that such a PTR policy would not lower student achievement levels. The final column of Table 11 shows the ratio of hypothetical savings to costs if government were to maintain a PTR of 40 in its elementary schools. While in the hilly states it may not be feasible to maintain PTR at 40, it is noticed that in states such as Kerala and Tamil Nadu, the savings will be about twice the current total teacher salary cost, because of the low current PTR in these states which is around 13 pupils per teacher. In 9 out of 21 states, the savings (at PTR 40) will be higher than the

current total cost of teacher salary, and this type of scenario building can help to think about whether and how economic efficiencies could be gained without compromising pupil learning.

#### X. Savings from adjusting RTE teacher allocation norms to current enrolment realities

Table 12 presents estimates of total savings to the public purse if an adjustment were made to the teacher-allocation norms of the RTE Act in light of the changed realities of enrolment in public elementary schools.

Table 2 had shown that in the seven years since the implementation of the Act (in 2010), there was a substantial abandonment of public schools and a migration to private schools, and Table 3 showed that this led to an increase in the phenomenon of ‘small’ and ‘tiny’ public schools. Table 4 shows that by 2017-18, nationally 47.7% of all public elementary schools had a total enrolment of 60 or fewer ( $\leq 60$ ) pupils. Later in the paper, Table 13(a) shows that these 493,848 (out of the total 1,035,338) ‘small’ schools had on *average* only 31.6 pupils per school and 13.2 pupils per teacher. When we look at public schools with a total enrolment of 20 or fewer ( $\leq 20$ ) students, the story becomes more alarming. Table 3 shows that there were 126,864 such schools in the country, i.e. 12.3% of all public elementary schools, and that they had, on *average*, only 12.6 students per school and 6.3 pupils per teacher, manifestly both pedagogically and economically unviable.

It is likely that, when setting the teacher-allocation rules, the RTE Act’s framers did not envisage the unprecedented exodus from public schools that would happen, which has led to average school enrolment being so low. As per the RTE Act’s teacher allocation rule, all schools with up to a total enrolment of 60 are to be provided two teachers.

However, in line with new enrolment realities, government might consider modifying the teacher allocation rule to a more reasonable one. We consider a hypothetical rule of allocating one teacher in all schools that have a total enrolment of  $\leq 20$  (which have an *average* enrolment of 12.6 pupils per school), and allocating two teachers in all schools with a total enrolment of 21 to 60 pupils. The remaining allocation rules remain untouched, i.e. for schools with enrolment above 60.

Table 12 shows the consequences of applying such an alternative rule. Column (g) shows that if one teacher is allotted per school with enrolment  $\leq 20$ , there will be nationally a net teacher surplus of 303,471 teachers<sup>xv</sup>, instead of the net vacancies of 26,660 under the current RTE teacher allocation norms. As seen in column (k), this would yield total savings of Rs. 147.53 billion or US \$ 2 billion<sup>xvi</sup> per year (in 2017-18 terms), compared to the actual teacher salary expenditure in 2017-18.

If we take only ‘true’ enrolment i.e. we remove the ghost/fake students, then column (j) shows that net teacher surplus increases to 763,735 teachers, and this massive teacher surplus leads to an excess expenditure of Rs. 388.45 billion or US \$ 5.3 billion per year (in 2017-18 prices). Table 12 shows wide inter-state disparity, with West Bengal having more than 145,000 excess teachers.

Although in the interests of space and brevity, we do not show a separate table, the PTR under the above modified teacher allocation rule would be 24.5 pupils per teacher, compared to the current 22.8, i.e., well below 30 pupils per teacher.

#### XI. Small schools with extreme teacher surpluses

Tables 13 and 14 examine the cases of ‘small’ schools that have an extreme surplus of teachers. Table 13 relates to all schools with less than or equal to 60 (i.e.  $\leq 60$ ) reported students, which for the purposes of this section we shall call ‘small’ schools, and Table 14 relates to all schools with  $\leq 20$  students which we

shall call ‘tiny’ schools. As in the whole of the rest of the paper, we are only considering public elementary schools.

Table 13(a) shows that there were 493,848 small schools ( $\leq 60$  pupils), that they constituted 47.7% (i.e. nearly half) of all schools, that they had an average of 31.6 students per school, an average of 2.4 teachers per school and thus a PTR of 13.2 pupils per teacher. In other words, roughly half of all public schools in the country had an average PTR of 13.2 pupils per teacher !

While column (g) shows that 1.7% of small schools had zero teachers and 13.6% had one teacher (teacher deficit schools) and 57% schools had the (desired) two teachers, the remaining 27.6% of small schools had teacher surpluses. 15% had three teachers, 6.5% had four teachers and 6.1% of all schools had 5 or more teachers, and it is this last category we focus on, here.

Table 13(b) shows the average PTRs in the ‘small’ schools: in small schools with one teacher, PTR was 25.7; with two, three and four teachers, PTR was 14.9, 12.8 and 10.1 respectively. In small schools with five or more teachers, PTR was merely 5.4, a case of extreme teacher surplus. The remaining columns indicate that there were 30,246 such profligate ‘small’ schools, that they had 224,107 teachers (i.e. a mean of 7.4 teachers per school), a pupil teacher ratio of 5.4 pupils per teacher, and a per-pupil-expenditure on teacher salary alone of Rs. 94,939 in 2017-18, which was equal to 82.3% of the national per capita income<sup>xvii</sup> that year ! This implies a total teacher salary cost of Rs. 115.12 billion or about US\$ 1.6 billion in 2017-18 on these 30,246 ‘small’ public schools with an extreme teacher surplus. This was higher than the entire GDP of Gambia or Belize that year.

Table 14(a) shows that there were 126,864 ‘tiny’ public schools in the country in 2017-18, i.e. schools with a total reported enrolment of 20 or fewer ( $\leq 20$  pupils), which constituted 12.3% of all public schools. These had on average 12.6 students per school, an average of 2 teachers per school, and thus a PTR of 6.3 pupils per teacher ! While 4.2% of these tiny schools had zero teachers, and 22.6% had one teacher (which seems perhaps not unreasonable, given an average enrolment of only 12.6 students per school), in the latter columns we see that 60.4% of these schools had two teachers, 7.5% had three teachers, and 5.3% had four or more teachers (2.6% had four teachers and 2.7% had five teachers). While nationally there were only 2.7% of tiny schools with  $\geq 5$  teachers, in some states that figure is much higher, e.g. in Bihar and Kerala the figure is more than 10%, and in Assam and Kashmir, it is more than 8%.

Table 14(b) shows that among the tiny schools, those with one teacher had a PTR of 11.3, those with (the RTE Act mandated) two teachers had a PTR of 6.8, those with three or more teachers had a PTR of mere 3.2 pupils per teacher! The last row of Table 14(a) columns (i), (j) and (k) showed that 12.8% of all tiny schools had  $\geq 3$  teachers, which is equal to 16,151 schools. Table 14(b) shows that these 16,151 tiny schools with  $\geq 3$  teachers had a total of 67,689 teachers, 4.2 teachers per school, and a per pupil salary expenditure of Rs. 161,218 in 2017-18, which implies a total expenditure of Rs. 34.77 billion (US\$ 476 million) per year on these ‘tiny’ public schools with an extreme teacher surplus.

## **XII. Conclusions**

This paper questions the education ministry’s estimate of one million teacher vacancies in public elementary schools which is the basis for the widely-perceived acute teacher shortage, and which has understandably been uncritically accepted by the framers of the National Education Policy (NEP 2020). We ask whether the vacancy estimates are supported by evidence, and we explore teacher surpluses and fake student enrolment, and consider the implications of these for pupil teacher ratios (PTRs). The paper also calculates the fiscal cost to the exchequer of maintaining PTR at the levels prescribed in the NEP 2020 and the Right

to Education (RTE) Act 2009. We restricted analysis to public elementary schools only, in 21 major states of India which constitute 97% of the country's population.

We find that compared to the published national PTR of 22.8, the true PTR (after adjusting for fake enrolment) is 19.6, i.e. very substantially lower than the mandated maximum of 30 in the RTE Act. *Prima facie* this suggests a large number of surplus teachers in relation to the teacher-allocation norms, and calls into question the notion of an acute teacher shortage in the country.

The paper has several key findings. Firstly, while the paper broadly confirms the government-estimated large number of teacher vacancies (calculated in relation to the RTE Act's teacher-allocation norms), it shows that, applying the same norms, there are also roughly the same number of surplus teachers, so that there is hardly any *net* deficit of teachers, i.e. a deficit of only 26,660 teachers, compared to the widely publicised one-million teacher vacancies.

State-wise analysis of this total net national deficit of 26,660 teachers shows that eight states have net teacher deficits (i.e. net vacancies) and thirteen states have net teacher surpluses. It is seen that 73% of all net teacher surpluses in the country are in West Bengal, Tamil Nadu, Assam, Punjab, Rajasthan, and Kerala, where large savings can result from reducing surplus teachers, e.g. via attractive voluntary retirement schemes and/or stopping fresh recruitment, etc. 84 per cent of all net vacancies are in four states of Bihar, Jharkhand, Madhya Pradesh and Uttar Pradesh and thus it is mainly these four states that need close attention from a teacher shortage perspective. While there is great scope for within-district redeployment of teachers from surplus to deficit schools in net teacher surplus states, we illustrate how district level redeployment can help fill many teacher shortages even in a net-teacher-deficit state such as Uttar Pradesh.

Secondly, we find that official teacher vacancy estimates are based on taking schools' self-reported pupil enrolments at face value, but that adjusting for the well-known fake enrolments i.e. over-reported pupil numbers, nearly halves the number of teacher vacancies. The fake enrolments are clearly visible in the histogram in Figure 1. If government continues to use reported (inflated) enrolment to estimate teacher vacancies, and fills its claimed nearly one million teacher vacancies based on these *prima facie* (unadjusted) enrolment numbers, the already modest mean PTR of 22.8 would fall further to 15.9 nationally, at a cost of nearly Rs. 480 billion (USD 6.6 billion) per year in 2017-18 prices, creating a huge permanent fiscal burden.

Thirdly, we show that combining both ideas – i.e. first removing fake enrolments and second estimating additional teachers required to fill only *net* teacher vacancies (that remain after removing surplus teachers) – would imply that instead of a deficit of nearly one million teachers, there would be 341,900 net surplus teachers. Inter-state analysis of this net surplus shows that in fourteen states there is a sobering net surplus of 515,704 teachers (maintained at a cost to the public exchequer of Rs. 264.9 billion or approx. US \$ 3.63 billion per annum in 2017-18 terms), and in seven states there is net deficit totalling 173,763 teachers, of which 86% is in only four states (Bihar, Jharkhand, Karnataka, Madhya Pradesh), implying that national policy makers need to focus on teacher shortages mainly in these four states.

Fourthly, the paper shows the annual fiscal burden of surplus teachers due to two factors: first, maintaining the current PTR of 22.8 rather than the permitted maximum PTR of 30, costs the exchequer Rs. 551.69 billion; second, the fiscal burden of additional recruitment to fill the supposed (882,200) teacher vacancies that the National Education Policy 2020 promises will be urgently filled, would be Rs. 478.79 billion per annum. This adds up to an annual fiscal burden of Rupees 1030.48 billion (US\$ 14.1 billion) per annum in 2017-18, which was roughly equal to the total GDP of Madagascar or Mongolia that year, and was higher than the individual GDPs of 86 countries!

Fifthly, the paper shows how the RTE Act's rule of providing two teachers to any school with up to 60 students, leads to two teachers being allocated even to 'tiny' schools (those with 20 or fewer total students)

whose numbers have been swelling every year due to the emptying of public schools. Given that in the nearly 127,000 ‘tiny’ public schools with  $\leq 20$  pupils, there were on average merely 12.6 pupils per school, the RTE-mandated appointment of two teachers leads to an average PTR of a mere 6.3 pupils per teacher, a seriously unviable situation. The paper shows that if this rule were modified, with only one teacher being allocated to schools with  $\leq 20$  students, there would be a net surplus of 303,471 teachers even without adjusting for fake enrolment, and if we remove the estimated fake students, net teacher surplus is 763,735 teachers, which implies an excess expenditure of Rs. 388.45 billion or US \$ 5.3 billion per year (in 2017-18 prices).

Sixthly, the paper examines schools that have an extreme teacher surplus, to quantify this aspect of economic wastage of scarce educational resources. We find that there were 30,246 small schools with a total enrolment of  $\leq 60$  pupils and with five or more teachers; these ‘small schools with surplus teachers’ had on average 40 pupils, 7.4 teachers, a PTR of 5.4 pupils per teacher; they had a total annual teacher salary bill of Rs. 115.12 billion (US\$ 1.6 billion per year) in 2017-18, and a per-pupil-teacher-salary-expense of Rs. 94,939 in 2017-18, which was more than 82% of the per capita income of India (and 2.5 times the per capita income of Bihar state) that year.

Similarly, there were 16,151 tiny schools which had a total enrolment of  $\leq 20$  pupils and had ‘three or more teachers’; these tiny schools had on average 13.4 pupils, 4.2 teachers, an extremely low PTR of 3.2 pupils per teacher, a total salary expenditure of Rs. 34.77 billion (US\$ 476 million) per year, and a per-pupil-salary-expense of Rs. 161,218 in 2017-18, which was 140% of (or 1.4 times) India’s per capita income (and 4.2 times the per capita income of Bihar state) in that year.

Seventhly, the paper shows that about Rs. 628 billion expenditure on teacher salaries is wasted each year due to teacher absenteeism and ghost pupil enrolments, suggesting areas of scope for greater efficiency. The wastage due to estimated ghost/fake enrolments is Rs. 265.14 billion (US\$ 3.6 billion) and that due to teacher absence is Rs. 362.42 billion (US\$ 5.0 billion).

Eighthly, India stipulated a maximum PTR of 30 in primary schools but – in the international and Indian literature cited above – there is little empirical support for the idea that reducing PTR raises pupil learning. We estimated that maintaining a PTR of 40, compared to the current PTR of 22.8, would save Rs. 733.86 billion (US \$ 10 billion) per year, in 2017-18 prices.

This paper has tried to provide evidence based on the government’s official DISE data collected from all the 1.035 million public elementary schools in the country. One caution is that while DISE follows data validation, consistency checks and a 5% sample check, and is widely used by researchers and by the education ministry as the basis for its Annual Work Plan and Budget process, it has some data quality issues. Another caveat is that while fake enrolment estimates were available for some states from the Comptroller and Auditor General, the Mid Day Meal Authority and some research studies, estimates are not available for other states and we have imputed fake enrolment estimates from these states to other states based on an arbitrary assumption. Ideally states need to re-do the analysis based on their own estimates of fake enrolment through surveys. There is also no well-established methodology for estimating fake enrolments, so the extent of fake enrolment may be contested.

Clearly there are major policy implications of these findings. Firstly, the findings call for a review of the teacher allocation rules enshrined in the Right to Education Act 2009 which mandates two teachers even for tiny schools whose numbers have rapidly grown in recent years, and because these allocation rules emphasise teacher inputs, specifically a maximum pupil teacher ratio of 30, despite evidence that class size is not significantly related to student learning, and despite the lack of a known ‘threshold’ at PTR 30.

Secondly, the smallness of many public schools seen here raises questions not only of their economic justifiability but also of their pedagogic viability and scope for offering children adequate socialisation

opportunities. Parental abandonment in the country's (1.035 million) public elementary schools had, by 2017-18, slashed the median public school size to a mere 64 pupils (using schools' self-reported enrolment), and this has major implications for policy on school size and on teacher recruitment.

Thirdly, to reduce wastage, it seems quite important to have data on actual enrolment in schools, so that teacher allocation is not based on inflated / over-reported pupil enrolment numbers. Some states have encouraged removal of fake enrolment from schools' self-reported enrolment numbers by Adhaar card (unique national ID) linkage such as Haryana, and lately Uttar Pradesh government linked its Direct Benefit Transfer (DBT) to parents for school uniform, bag, shoes, etc. based on the child's Adhaar card number being provided.

Lastly, and most importantly, given the estimated half a million surplus teachers in fourteen net-teacher-surplus states, the governments of these states need to consider how much of the problem of teacher shortage in some schools should be solved by net new hiring and how much by reallocation of teachers from surplus-teacher-schools. In principle, a number of ways can be used to rationalise surplus teachers, e.g. by putting a freeze on fresh recruitment, incentivising teachers to accept re-deployment, and voluntary retirement schemes etc., but in practice transferring teachers may be administratively and politically challenging. Yet the state needs to consider how fair it would be for the citizen/taxpayer to pay for the 'hedonic rent' that a large number of individual teachers get from assignments near home with few students to teach, and whether it is legitimate to incur large fiscal costs not because the state has too few teachers but because it cannot or will not reassign teachers from very small schools or teacher-surplus schools, and hence not reach the permitted upper limit of class-sizes and pupil-teacher-ratios.

District wise analysis within each state would be fruitful to see the scope intra-district or intra-division redeployment of teachers from surplus to deficit schools, and would be a fruitful area for research.

Source: www.statereportcards/rawdata/201011 Data here is for 20 major states in 2010-11 and (counting Telengana as a separate state) for 21 major states in 2017-18.

Note: Data on public school teachers' salary is taken from Ramchandran (2015), where the simple mean of public primary school teacher salary in six states (averaged across new and experienced teachers) was 40,623 per month in 2014-15. For 2017-18/2010-11, it has been inflated/deflated by 8.5%, assuming a salary inflation rate of 8.5% per annum, based on salary escalation in one state i.e. Uttar Pradesh, see Annex Table 2 in Kingdon (2017). Thus, average primary teacher salary is taken as Rs. 29,312 in 2010-11 and 51,887 in 2017-18. Note that about one third of all public elementary schools are middle schools, and their teachers earn salaries that are about 30% higher, but we have assumed that all schools are primary, and thus taken only primary teacher salary rates to calculate the per pupil salary expenditure. Thus, average salary level used here therefore is under-estimated; however, at the same time, we have imputed the regular teacher salary to all teachers even though about 13% of all teachers are contract teachers whose salary rate is lower than regular teachers'. Among schools with <=100 pupils, while mean pupils per school is 45.3, median pupils per school is 41.0. This is based on schools' self-reported enrolment, which is known to be inflated, i.e. the true mean and median school size are even lower.

**Table 4: Percentage of public schools with ‘total student enrolment’ below given levels, 2017-18**

State	Percentage of schools with ‘Total student enrolment’ of:							Average school size (among all schools with enrolment ≤100)	Average school size

<b>India (21 major states)</b>	<b>12.3</b>	<b>23.3</b>	<b>33.2</b>	<b>41.2</b>	<b>47.7</b>	<b>59.4</b>	<b>67.6</b>	<b>45.3</b>	<b>98.8</b>

Note: To illustrate how to interpret this table, Column (a) last row shows that in India, 12.3 per cent of all public elementary schools had a total enrolment of ‘20 or fewer’ students; column (d) shows that 41.2% of all public schools had ‘50 or fewer’ pupils, and so on. In the hilly states of Uttaranchal 83%, Himachal 86.5% and Kashmir, about 80% (79.8%) of all public schools have ‘60 or fewer students’. ‘Average school size’ in column (h) shows the average number of students per school among all public schools where the enrolment is fewer than 100 (i.e. in the 67.6% of all public schools in the country). The India row here and in all tables below represents the above listed 21 major states constituting 97% of the population. The table is sorted by column (a).

Source: Authors’ calculations from DISE 2017-18 data.

Note: The table is sorted by column (a). The India row in column (f) shows that nationally 30.8% of all schools with a total enrolment of <=60 have >2 teachers, i.e. have surplus teachers, as per the teacher-allocation norms. Columns (a) to (e) use the schools’ reported total enrolment at face value (as genuine students) but it is well known that a part of total enrolment is over-reported, consisting of ghost/fake students. To illustrate, in Uttar Pradesh, a reported total enrolment of 70 when deflated by removing its ghost enrolment (16%), comes to an actual/true enrolment of 60 students. When we take reported enrolment in column (e) we conclude that in UP, 49.8% of all schools with total enrolment<=60 have >2 teachers, but when we take actual/true enrolment in column (f) we conclude that 53.6 per cent of all schools with total enrolment<=60 have >2 teachers. Evidence on ghost/fake enrolments is discussed in the Note to Table 7.

**Table 7: Estimating fake enrolment and Pupil teacher ratio (PTR) after removing ghost enrolment**

Source: \$- Source of student and teacher attendance rates in columns (f) and (g) is ASER (2018). Note: The table is sorted by column (e).

Note: A national student attendance of 72% implies an absence rate of 28%, but this represents partly genuine absence of enrolled children, and partly ghost enrolment, i.e. children who are not enrolled in school but who are shown to be enrolled. <sup>##</sup> These are the actual percentage of ghost enrolment in the marked states, based on studies. For all other states, ghost enrolment is calculated as 0.31\*(1-f), where the quantity in column (f) is the attendance rate and (1-f) is pupil absence rate. For Uttar Pradesh CAG (2017) estimates suggest a ghost enrolment of just over 20% of total enrolment, and Kingdon and Banerji (2009) estimate it to be 16%; For Bihar, CAG (2014) reports a ghost enrolment of 38% of total enrolment, and Kingdon and Banerji (2009) report it to be 35%. For these two states, we take fake enrolment to be 16% and 35% respectively, i.e. lower of the fake enrolment estimates of the two studies. For Haryana, Vasudeva (2017) estimates that 16% of enrolment was fake. For every other state (other than UP, Bihar and Haryana) we calculate the ghost enrolment as follows: Fake enrolment is some sub-set of total absence rate. In Bihar the pupil attendance rate is 56%, i.e. absence rate is 44%. Out of total enrolment, 35% is fake, so 35/44 or 79.5% of total *absence* is ghost enrolment. In UP attendance rate is 60%, and absence rate 40%. 16% of total pupil enrolment is fake, i.e. 16/40 or 40% of the total absence is fake enrolment. In Haryana, total pupil attendance is 78%, so absence rate is 22%. Of this, 16 points is fake (Vasudeva, 2017), i.e. 16/22 or 72.7% of the pupil absence is due to fake enrolment. Taking the weighted average of these three (UP 40.0%; Bihar 79.5% and Haryana, 72.7%) shows that fake enrolment is about 62% of total pupil absence in a state. However, these figures are for the educationally less well performing states. We conservatively assume that only half that i.e. 31% of the reported absence rate in any state is due to ghost enrolments (though this may underestimate fake enrolment in Jharkhand and some other north Indian states). Thus (1-f)\*0.31 gives the ghost enrolment rate estimate for each state. The All-India ghost enrolment estimate of 14% is the weighted mean of all the states' ghost enrolments. <sup>\*\*</sup> Column "i" is computed as (attendance rate/(1-ghost enrolment rate)).

**Table 8a: Teacher vacancies and teacher surpluses, 2017-18**

**Note:** The table is sorted by column (f). \*-includes Telangana. The teacher vacancies in column (d) are calculated by applying the teacher requirement norms given in the Schedule of the RTE Act (2009) for each and every public elementary school, and then totalled for the state as a whole. These norms state that for classes 1 to 5, in a school of up to a total enrolment of 60 pupils, two teachers are required; in a school with 61 to 90 pupils, 3 teachers are required, and so on, up to a total enrolment of 150, after which a head master is required i.e. a total of six teachers (including the headmaster). Beyond enrolment of 200, a pupil teacher ratio of 40 is to be maintained, plus a head teacher. For classes 6 to 8, minimum three teachers are required for a total enrolment upto 100, and beyond that maintaining a pupil-teacher ratio of 35:1 along with a separate head teacher. If 'Net Excess teachers' is negative, it represents teacher vacancies. Ghost enrolment figures are based on column (h) in Table 7 above. The cost calculations in the last two columns are in Rupees billion, and they are based on reported enrolment; If we adjusted for ghost enrolments, i.e. if the calculations were based on column (i), the estimated teacher vacancies would be lower (in fact in most states it would be teacher surpluses) and the cost savings would be far bigger.

**Source:** For columns a, b, and c: MHRD (2018) - Unstarred question no. 1953, Lok Sabha, on 30.07.2018.

Note: <sup>s</sup>- All Figures are in Indian Rupees billion. \*- includes Telangana. The table is sorted by column (f). RTMS is Regular Teacher Monthly Salary. State wise salary of regular public-primary-school teachers with 15 years of experience (taken as mean salary, averaging across new and experienced teachers) has been obtained from Ramachandran (2015) who provides salary data for seven major states for July 2014. We have inflated that to 2017-18 using the inflation rate, and added to it mean primary-teacher salary rate for West Bengal, and then taken the weighted mean of these eight states as the Regular Teacher Mean Salary (RTMS) figure for India, which comes to Rs. 42,808 per month in 2017-18. We have imputed that as the 2017-18 monthly salary rate in all the other states. Note that this RTMS used in Table 9 onwards here is lower than that used by Kingdon (2020) which is reproduced in Table 3 above. The reason is that Kingdon (2020) used the simple rather than weighted mean of salaries across the states from Ramachandran (2015) and because the current paper also adds data for West Bengal where teacher salaries are significantly lower than in the states covered in Ramachandran (2015). We have not taken into account the salaries of upper primary public school teachers, which are about 30% higher than those of primary teachers, and about one-third of all public elementary schools are upper primary schools. Thus, our national mean teacher salary figure of Rupees 42,808 per month is if anything an underestimate of regular public elementary school teachers' salaries.

Column i shows 'Wastage' due to maintaining a PTR of 22.8 instead of 30.

Column j shows cost of planned future recruitment to fill 882200 teacher vacancies estimated by the MHRD as per RTE norms (column d). This is the same as in column (j) of Table 8(a).

**Table 10: Fiscal cost due to teacher absence and fake pupil enrolment, 2017-18**

Source: DISE data 2017-18. The public elementary school regular teachers' salary data (with which the fiscal cost figures are estimated) is from Ramachandran (2015).

Note: Same as Table 9. This table is sorted by column (d). The definition and calculation of ghost enrolment (GE) are shown in the note to Table 7. Nationally the pupil absence rate is 28% (see column d), which implies that actual attendance rate is only 72% of enrolment. Column (f) is based on that portion of the 'pupil absence' which is due to ghost/fake enrolment. The cost of teacher absence for any given state is calculated by taking the total teacher salary cost in the state and multiplying that with the teacher absence rate in the state.

**Table 11: Teacher salary cost at current PTRs and the projected costs and savings at alternative hypothetical PTRs, 2017-18**

State	Total students	Total teachers (regular)	Total teachers (contract)	Total teachers	PTR	Actual cost at current PTR (Rs. billion)	Hypothetical cost (Rs billion)			Hypothetical savings (Rs billion)			Ratio of (hypothetical) savings to costs at PTR 40

<b>Major 21 States</b>	<b>102,320,384</b>	<b>3,905,678</b>	<b>576,300</b>	<b>4,481,978</b>	<b>22.83</b>	<b>2069.89</b>	<b>1781.37</b>	<b>1526.89</b>	<b>1336.02</b>	<b>288.52</b>	<b>543.00</b>	<b>733.86</b>	<b>0.55</b>

Note: Cost and Savings figures are salary costs in INR billion. RTMS=Regular Teacher Monthly Salary. CTMS=Contract Teacher Monthly Salary,  $f=(b*RTMS+c.CTMS)*12$ ,  $g=(a/Hypothetical PTR)*(RTMS)*12$ . State wise contract teacher's remuneration is obtained from Ramachandran (2015) and from the All India Para Teacher Association. The table is sorted by column (e).

The cost of teachers in column (g) has been estimated at the public *regular* teacher salary rate which is much higher than the contract teacher salary rate. In Uttar Pradesh, where current PTR is 27.2, increasing the PTR to 30 should lower the number of teachers and thus lower the teacher salary cost, but it does not, it slightly raises it (from 306.27 billion in column (f) to Rs. 315.20 billion (column g, under the heading PTR 30). The reason for this is that many teachers in UP (and indeed in Bihar and Jharkhand particularly) were contract teachers in 2017-18, so for these states, assessing teacher salary cost at the regular teacher rate greatly increases the total cost of teachers when we move from column f to column g, under the heading PTR 30).

Teacher's salary rate is taken from Ramachandran (2015) which presents data for 5 states (Tamil Nadu, Punjab, Karnataka, Uttar Pradesh and Jharkhand) and for West Bengal average salary data is taken from pay-roll of selected schools. For the remaining states, the monthly salary data is obtained by taking the weightage average of the salary of the above six states. The salary data of Ramachandran (2015) paper is for 2014-15, so the salary estimate for 2017-18 is obtained by taking an annual 8.5% growth rate of salary every year, based on the actual salary escalation rate in Uttar Pradesh shown in Appendix Table 2 in Kingdon (2017).

**Table 12: Hypothetical total savings in 2017-18 if the RTE Act's teacher allocation norms are modified**

States	Total reported enrolment	'True' enrolment (after removing ghost students)	Under existing RTE norms of teacher allocation		Under a modified norm of teachers allocation (One teacher for ≤20 pupils & two teachers for 21-60 pupils#. Other norms remain unchanged)							
					Based on reported enrolment (of column a)			Based on 'true' enrolment i.e. after removing ghost students (i.e. based on column b)			Excess expenditure ('wastage') (Rs. billion)	
			Net-surplus teachers based on reported enrolment	Net-surplus teachers based on 'true' enrolment	Teacher vacancies	Excess teachers	Net-surplus teachers	Teacher vacancies	Excess teachers	Net-surplus teachers	Due to net surplus teachers (based on reported enrolment)	Due to net surplus teachers (based on 'true' enrolment*)

Note: Columns (e) to (j) are based on a proposed modified teacher-allocation norm for schools. The Right to Education (RTE) Act's norm is to allocate two teachers for all schools with a total enrolment of up to 60 pupils. The modified norm used here is to allocate one teacher for all schools with a total enrolment of up to 20 pupils, and to allocate two teachers for schools with 21 up to 60 pupils. # the norm is being modified ONLY for the case of 'primary only' schools. \* i.e. after removing Ghost students. Cost (or expenditure) figures are in INR billion. The table is sorted by Column (j).

**Table 13(a): Proportion of public schools with total enrolment of <=60 AND 'total teachers' equal to given levels, 2017-18**

States	Total no. of schools with <= 60 pupils	% of schools with <=60 pupils	Mean enrolment per such school	Mean no. of teachers per such school	Mean PTR in such schools	% of schools with zero pupils	Of all the 493848 public schools with <=60 enrolment, percentage with the following levels of 'total teachers'

Source: DISE 2017-18 data.

Note: Table is sorted by column (i). The total teacher salary cost of educating the 1.2 million children (column h) who are studying in public schools that have <=60 pupils and which have 5 or more teachers was just over Rs. 115.12 billion ( Rs. 11,512 crore) in 2017-18 (not shown in the table); that amount divided by 1.212 million pupils gives Rupees 94,939 per pupil.

Source: Ministry of Education, Government of India (2020) Lok Sabha, Unstarred Question No. 1243, Answered on 19th Sept, 2020. The Ministry's reply to the parliamentary question included its justification for increased teacher vacancies. It said: "The recruitment of teachers is a continuous process and the vacancies keep arising due to retirement and additional requirements on account of enhanced students' strength".

Note: \*As in Table 8 above. \*\* Telengana is included under Andhra Pradesh, thus the table is effectively for 21 major states.

Figure 1: Histogram of total enrolment in public elementary schools, 2017-18

Note: The histogram shows the distribution of all public elementary schools by school size, i.e. by total enrolment. It shows that many schools report enrolment that is rounded to some desirable total, e.g. there are sudden peaks at a total enrolment of 20, 25, 30, 40, 50, etc. The trough at enrolment of 57, 58, 59 and 60 is made up by impressive spikes at 61, 62, etc. which is presumably because – as per the teacher allocation norms – up to a total enrolment of 60, a school gets two teachers but with a total enrolment of 61 to 90, it gets three teachers. Above enrolment of 100, a junior school gets a head-teacher and that is likely to explain the sudden spike in the number of schools that report an enrolment just above 100.

Figure 2: Histogram of total enrolment in public elementary schools, Uttar Pradesh, 2019-20

Note: See the note to Figure 1.

Figure 3: Histogram of net teacher surplus, and net teacher surplus after removing estimated fake enrolment

Note: The net teacher surplus is based on column (f) of Table 8(a); The net teacher surplus after removing estimated fake pupils is based on column (i) of Table 8(a).

---

<sup>i</sup> The draft NEP (NEP, 2019 p.56) states that “A further factor in the [learning] crisis in many areas relates to ... the PTR, which ... often exceeds 30:1, making learning for all much more difficult”, and (on p. 58) it asks “What can be done to reverse this crisis, and urgently? ..... Teacher vacancies will be filled as soon as possible”. On page 115 it cites that “according to government data, the country faces over 10 lakh [over 1 million] teacher vacancies” and on page 417, it advocates increasing the total government budget by 1.05 percentage points for increased staffing.

<sup>ii</sup> The two most recent citations are as follows: In reply to unstarred question number 1953 in parliament on 30.07.2018, the education minister gave the total number of teacher vacancies in public elementary schools as 900,316 in all states/UTs. A similar parliamentary question (unstarred question No. 1243), answered by the education minister on 19.09.2020 cites 1,035,001 teacher vacancies (see Appendix Table 1). The Ministry’s reply to parliament included its justification for increased teacher vacancies. It said: “The recruitment of teachers is a continuous process and the vacancies keep arising due to retirement and additional requirements on account of enhanced students’ strength”. We use the ministry’s 2018 estimates as those are close to the DISE data available to us, which is for the year 2017-18.

<sup>iii</sup> At upper primary level, RTE Act provides for at least three teachers, one each for Language, Science/Maths and Social Studies. Schools with primary or upper primary classes or with both primary and upper primary classes constitute an ‘elementary’ school. An ‘elementary school’ may be a ‘primary only’ school, or an ‘upper primary only’ school, or it may be a school that has both primary and upper primary classes, i.e. has grades 1 to 8.

<sup>iv</sup> This concomitant deepening of the learning crisis is attested in the government’s National Achievement Surveys of Grade V in 2011 and 2015 (NCERT, 2016), and is also corroborated by non-governmental annual learning surveys (ASER, 2010 to 2016).

<sup>v</sup> From an experimental (randomised control trial) evaluation in Gujarat, Banerjee, Cole, Duflo, and Linden (2007) show that reducing class size has no impact on student achievement. In a panel data setup, Muralidharan et al. (2017) do not find any correlation between changes in mean PTR in a village and changes in normalized test scores, and they also find that reducing PTR is highly positively correlated with teacher absence. This finding is consistent with the findings of Muralidharan and Sundararaman (2013). Finally, Datta and Kingdon (2021) using a student fixed-effects estimation approach, find a non-decreasing relationship between class size and student learning in secondary schools.

<sup>vi</sup> Krueger, 1999; Case and Deaton, 1999; Angrist and Lavy, 1999; Woessman and West, 2006; Altinok and Kingdon, 2012; Shen and Konstantopoulos, 2019. Hattie’s meta-analysis (2005) demonstrated a typical effect-size that was considered “tiny” or “small” relative to other educational interventions.

<sup>vii</sup> Elementary schools are schools that have grades 1 to 5; or 1 to 8; or 6 to 8. Telangana and Andhra Pradesh are considered one state, and are included here as Andhra Pradesh, since in 2010 they were one undivided state. Thus, in fact we show 20 states but the data is actually for 21 major states which together constitute 97% of the population of the country.

<sup>viii</sup> In the Indian number systems, equal to 10.35 lakh. One lakh is one hundred thousand; Ten ‘lakh’ is equal to one million; one ‘crore’ is equal to ten million or hundred lakh.

<sup>ix</sup> The District Information System on Education (DISE) survey format goes to each and every elementary school and is self-completed by the school, i.e. it gives the school’s self-reported data. This is aggregated at the level of the district and state and then nationally.

<sup>x</sup> Hindustan Times (2017) reported 2.0 lakh (0.2 million) fake enrolment out of 5.5 reported enrolment in 2080 primary schools of Araria district. If we extrapolate this number to the state level, this figure is close to 40% which is in the vicinity of the reported number of 35% in Bihar by Kingdon et al (2009) and of 38% reported by CAG (2014).

<sup>xi</sup> Rural parts of districts Agra, Shrawasti, Mahoba, Bijnor and Lucknow.

---

<sup>xii</sup> In an IZA Discussion Paper No. 14251 by Datta and Kingdon in April 2021, we explore the concepts of effective PTR and ‘cost-conscious’ PTR, based on adjusting for student and teacher absence rates.

<sup>xiii</sup> This explains the discrepancy between the MHRD estimate of 900,316 vacancies in the country as a whole, and the figure reported in the last row in column (c) of Table 8(a), which shows that for these 21 major states (Andhra included Telengana here), the MHRD’s total estimated vacancies were 882,200. That is, the vast bulk of national teacher vacancies are captured by the vacancies in these 21 major states.

<sup>xiv</sup> If we presume the Ministry’s sanctioned posts are decided as per the RTE Act’s allocation rules, it is not known why columns (c) and (d) differ.

<sup>xv</sup> Due to space constrains, we did not report the values of vacancies and excess teachers under either rule.

<sup>xvi</sup> We have used an exchange rate of Rs. 73 per US dollar. On 30<sup>th</sup> Sept. 2018, the rate was Rs. 72.5 per dollar.

<sup>xvii</sup> The per capita income of India is from Table 11 in <https://www.esopb.gov.in/static/PDF/GSDP/Statewise-Data/statewisedata.pdf> which takes data from the Central Statistical Organisation, Govt. of India, New Delhi.
